

TimeLens AI

**Plans should
learn from reality.**

Minimum viable proof of concept

Vansh, (1024030770)
Devyang, (1024030765)
Bhavik, (1024030772)

Planning fails at the first estimate.

People guess task duration.

Static planners preserve that error.

Every delay pushes the whole day off course.

One adaptive loop replaces static planning.

PREDICT

Correct the estimate.

SCHEDULE

Build a realistic day.

ADAPT

Move unfinished work after delays.

USER ESTIMATE

60

MIN

TIMELENS PREDICTION

95

MIN

Historical report-writing bias
and afternoon slowdown explain the
difference.

Four steps make the schedule adaptive.

04

Enter task

**Calculate
duration**

Place task

Record reality

Completion data improves the next prediction.

A deliberately small technical footprint.

Next.js
TypeScript
Prisma
SQLite

One codebase. Local persistence.
No authentication, cloud services, or external
APIs.

The demo proves one complete workflow.

35

MINUTE DELAY

Create task → compare prediction → generate schedule

Simulate delay → watch remaining tasks move.

SQLite

**turns the prototype
into evidence.**

Tasks persist.

**History
accumulates.**

**Predictions stay
explainable.**

**Reset returns the
demonstration to a known
state.**

**The MVP
validates
the core idea.**
